Conclusion

In line with our analysis, we can conclude that most of the food prices in Turkey seem to have increasing trends majorly due to:

- **Climate change impact** such as drought, excessive rain fall etc.
- Natural causes such as **pest infestation**
- Current **currency rates crisis**
- **Higher demand** due to increasing population
- **Insufficient supply** as oppose to high demand
- **Price changes** all over the world, especially **for imported ones**

In addition, we can say that 2018 food prices in Turkey have increased overall with a few exceptions in line with the reasons explained above.
